Hyundai

I was handling a call on the ATSG Tech Line about a 2000 Hyundai Elantra that had a complaint of a flare on the 2-3 shift.

Ordinarily, a KM unit with a 2-3 flare could have a problem with servo-release pressure, usually caused by the computer not shutting off the pressure-control solenoid quickly enough. There could be a problem with the servo switch if it were stuck. In other words, these are the usual components that could cause a 2-3 flare on a KM unit.

In this situation it was none of the usual items. It was, believe it or not, the transmission-fluid-temperature sensor. As I looked further into this, sure enough, I found factory bulletin 00-40-010 dated August 2000.

It seems that this vehicle had stored a P0712 for a shorted ATF-temp sensor, which causes the TCM to create a flared 2-3 shift in this vehicle model. Computer strategy seems to be the culprit here.

As I read the bulletin, I found other unusual computer strategies in play on various Hyundai model years, all related to the ATF-temp sensor and in what manner it failed.

If the ATF-temp sensor fails open and stores code P0713, the complaint would be a harsh garage shift from park to either drive or reverse and no converter-clutch application.

If the vehicle were a 1996-2000 Elantra or Tiburon, or a 1995-2001 Accent, the complaint would be no 4th gear.

If this were a 1999-2001 Sonata, the complaint would be no upshift past 2nd gear.

Should the ATF-temp sensor become shorted and a P0712 be stored, the 2-3 flared-shift complaint would affect 1996-2000 Elantra and Tiburon as well as 1995-2001 Accent.

In the event this happens to you, the part number of the ATF-temp sensor for the 1996-2000 Elantra and Tiburon and for the 1995-2001 Accent is 46386-22600.

The part number for the 1999-2001 Sonata is 46386-39050. TD

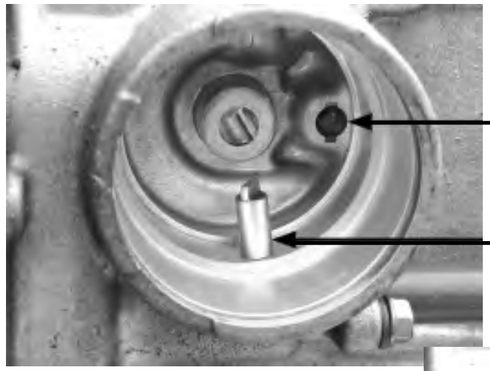
- Application: Ford Aspire

August 2001

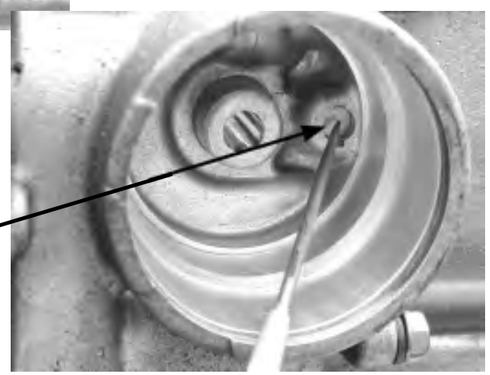
F3A

Slips in 3rd/Reverse, No 3rd/Reverse, Missing Plug in Servo Bore

Ford Aspire vehicles with an F3A transmission have a steel plug in the case inside of the servo bore. This plug is staked in at the factory, and often falls out of it's hole when the servo is disassembled. If this plug falls out and the hole is not plugged, front clutch/servo release oil will be exhausted and the result is a 3rd/reverse slip, or no 3rd/reverse. It is not critical that this specific plug be reinstalled, but the hole must be plugged off.



Approximate Plug Dimensions
.313" Diameter
.728" Overall Length
.078" Flatted End Thickness



The factory installed the flatted end in first (The end that resembles a flat blade screw driver).

NOTE: This part is not serviced by Ford.

Technical Bulletin #350

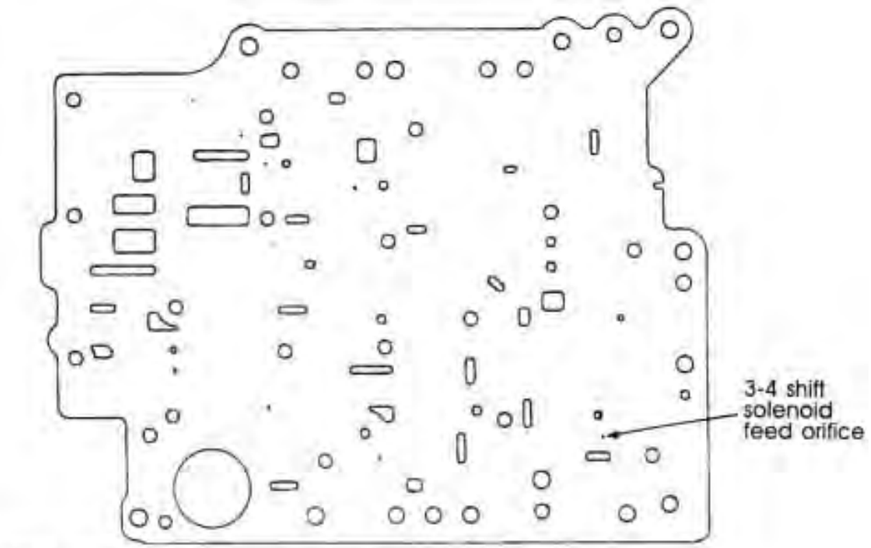
Transmission: *G4A-EL*
Subject: *3-4 Shift hunt*
Application: *Ford, Mazda*
Issue Date: *August, 2003*

G4A-EL

3-4 Shift Hunt

This condition may be caused by failure in the 3-4 shift solenoid hydraulic circuit. Monitor the shift solenoid signals from the computer. If the 1-2 shift solenoid is the only solenoid being cycled on and off during the 3-4 shift hunt, the 3-4 shift solenoid feed circuit has failed.

This condition is commonly caused by debris which has plugged the 3-4 shift solenoid feed orifice.



NOTE: This condition may also be caused by a leak in the 3-4 shift solenoid or the end plug of the 3-4 shift valve.

Go with the leader in transmission repair kits for over 40 years and stop leaky seals from compromising your work and reputation.

Some transmission seals just can't hold their fluid like others. To help keep the transmissions you rebuild on the road and out of your shop, make sure you use only parts and kits from one of the most trusted and respected names in transmission repair for nearly four decades – Precision International. We rely on the same top manufacturers who supply OEMs. We thoroughly inspect each and every incoming parts shipment for proper size, fit, material and appearance. And we constantly monitor OEMs for product changes or updates to eliminate surprises and help keep both of us on top of our game. Even more reassuring, our technical advisory group actually tests our kits out on the most current transmission designs before they go to market. So we often identify and solve potential transmission problems before the OEMs even discover them!

The best info and advice in the business

Precision also offers outstanding tech support and assistance, including our new website www.transmissionkits.com with over 80 videos featuring transmission expert John Parmenter. An industry first kit identifier by type of transmssion or model and year of vehicle, complete parts information and much more.

So you can troubleshoot any problem and offer your customers the very best transmission solutions possible. It's all part of our quality story and uncompromising commitment to you. After all, the last thing we want is a leaky seal draining your time and money.

Saturn TAAT — Delay in ‘D’ and/or Bind in Reverse

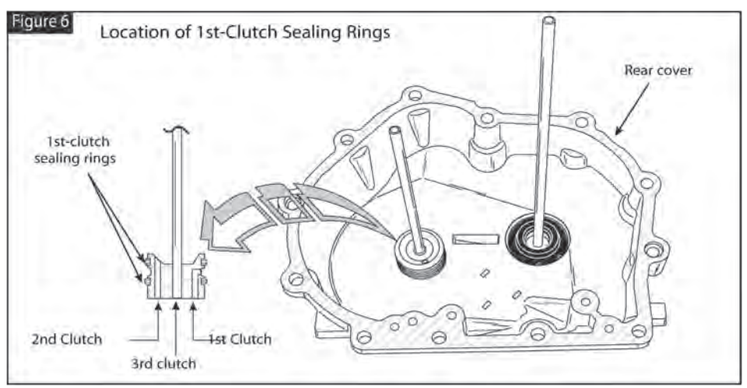
Complaint:

Before or after overhaul, Saturn vehicles equipped with the MP6 or MP7 transaxle may exhibit a slight engagement delay in “D” and/or a binding condition in reverse.

Cause:

The cause may be shrunken or damaged 1st-clutch sealing rings, as shown in Figure 6. When these rings leak they can cause a slow fill of the 1st clutch, which results in a delayed engagement in “D.” The first sealing ring also separates the 2nd clutch from the 1st clutch. When this ring leaks while in the Reverse range, the 1st clutch can now be applied with 2nd-clutch pressure, which results in a bind-up. See Figure 7 for a cross-sectional view of the mainshaft.

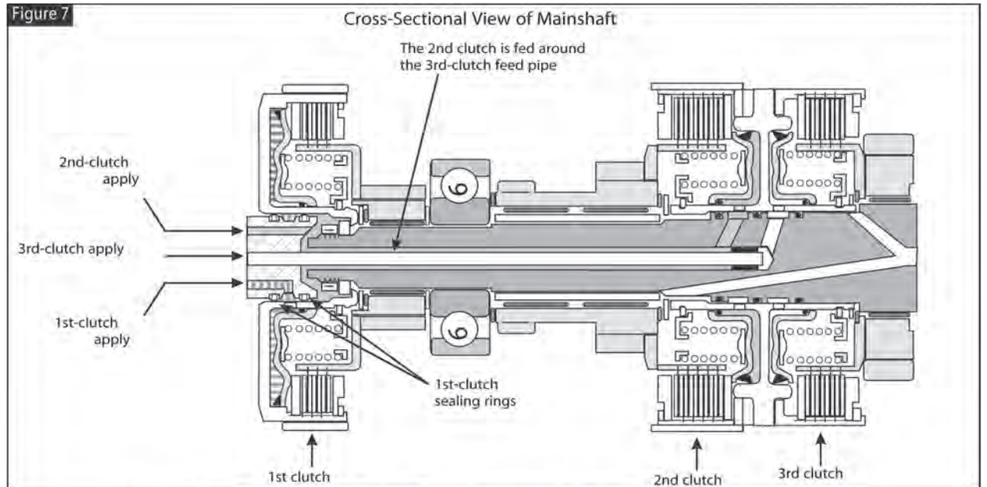
Figure 6 Location of 1st-Clutch Sealing Rings



Correction:

Replace the 1st-clutch sealing rings as part of every overhaul. TD

Figure 7 Cross-Sectional View of Mainshaft



Summary: When the 2nd clutch is applied in Reverse, shrunken 1st-clutch sealing rings may allow the 1st clutch to be applied at the same time, causing a bind-up.
